GAMA, a platform dedicated to build spatially explicit agent-based models and run simulations.

- ▶ **Generic:** it can be used for a wide range of applications
- ▶ **Open-source:** it is developed under GPL/LGPL license (GNU v3)
- ▶ **Designed to modellers:** it allows modellers (even non computer-scientists) to build models **quickly and easily:**
 - ▶ Integrates a complete modelling language (**GAML**) and
 - ▶ an **Integrated Development Environment**
- ▶ **Easily extensible to take specific needs into account:** it is developed in **Java** using **Eclipse IDE**, with an open architecture thanks to Java and Eclipse features (Java annotations and OSGI plugin framework.

GAMA overview: Strengths of GAMA

- ▶ Seamless integration of **geographic data and GIS** tools with agent-based models
- ▶ Supports the development of **quite complex models**
- ▶ Integrates a methodological approach to define **multi-level models**
- ▶ Integrates powerful **visualisation** tools
- ▶ Supports **multi-paradigm** models
- ▶ **Integrates tools to analyse models:**
 - parameters space exploration and calibration.
- ▶ Now compatible with R and OpenMole for further exploration.

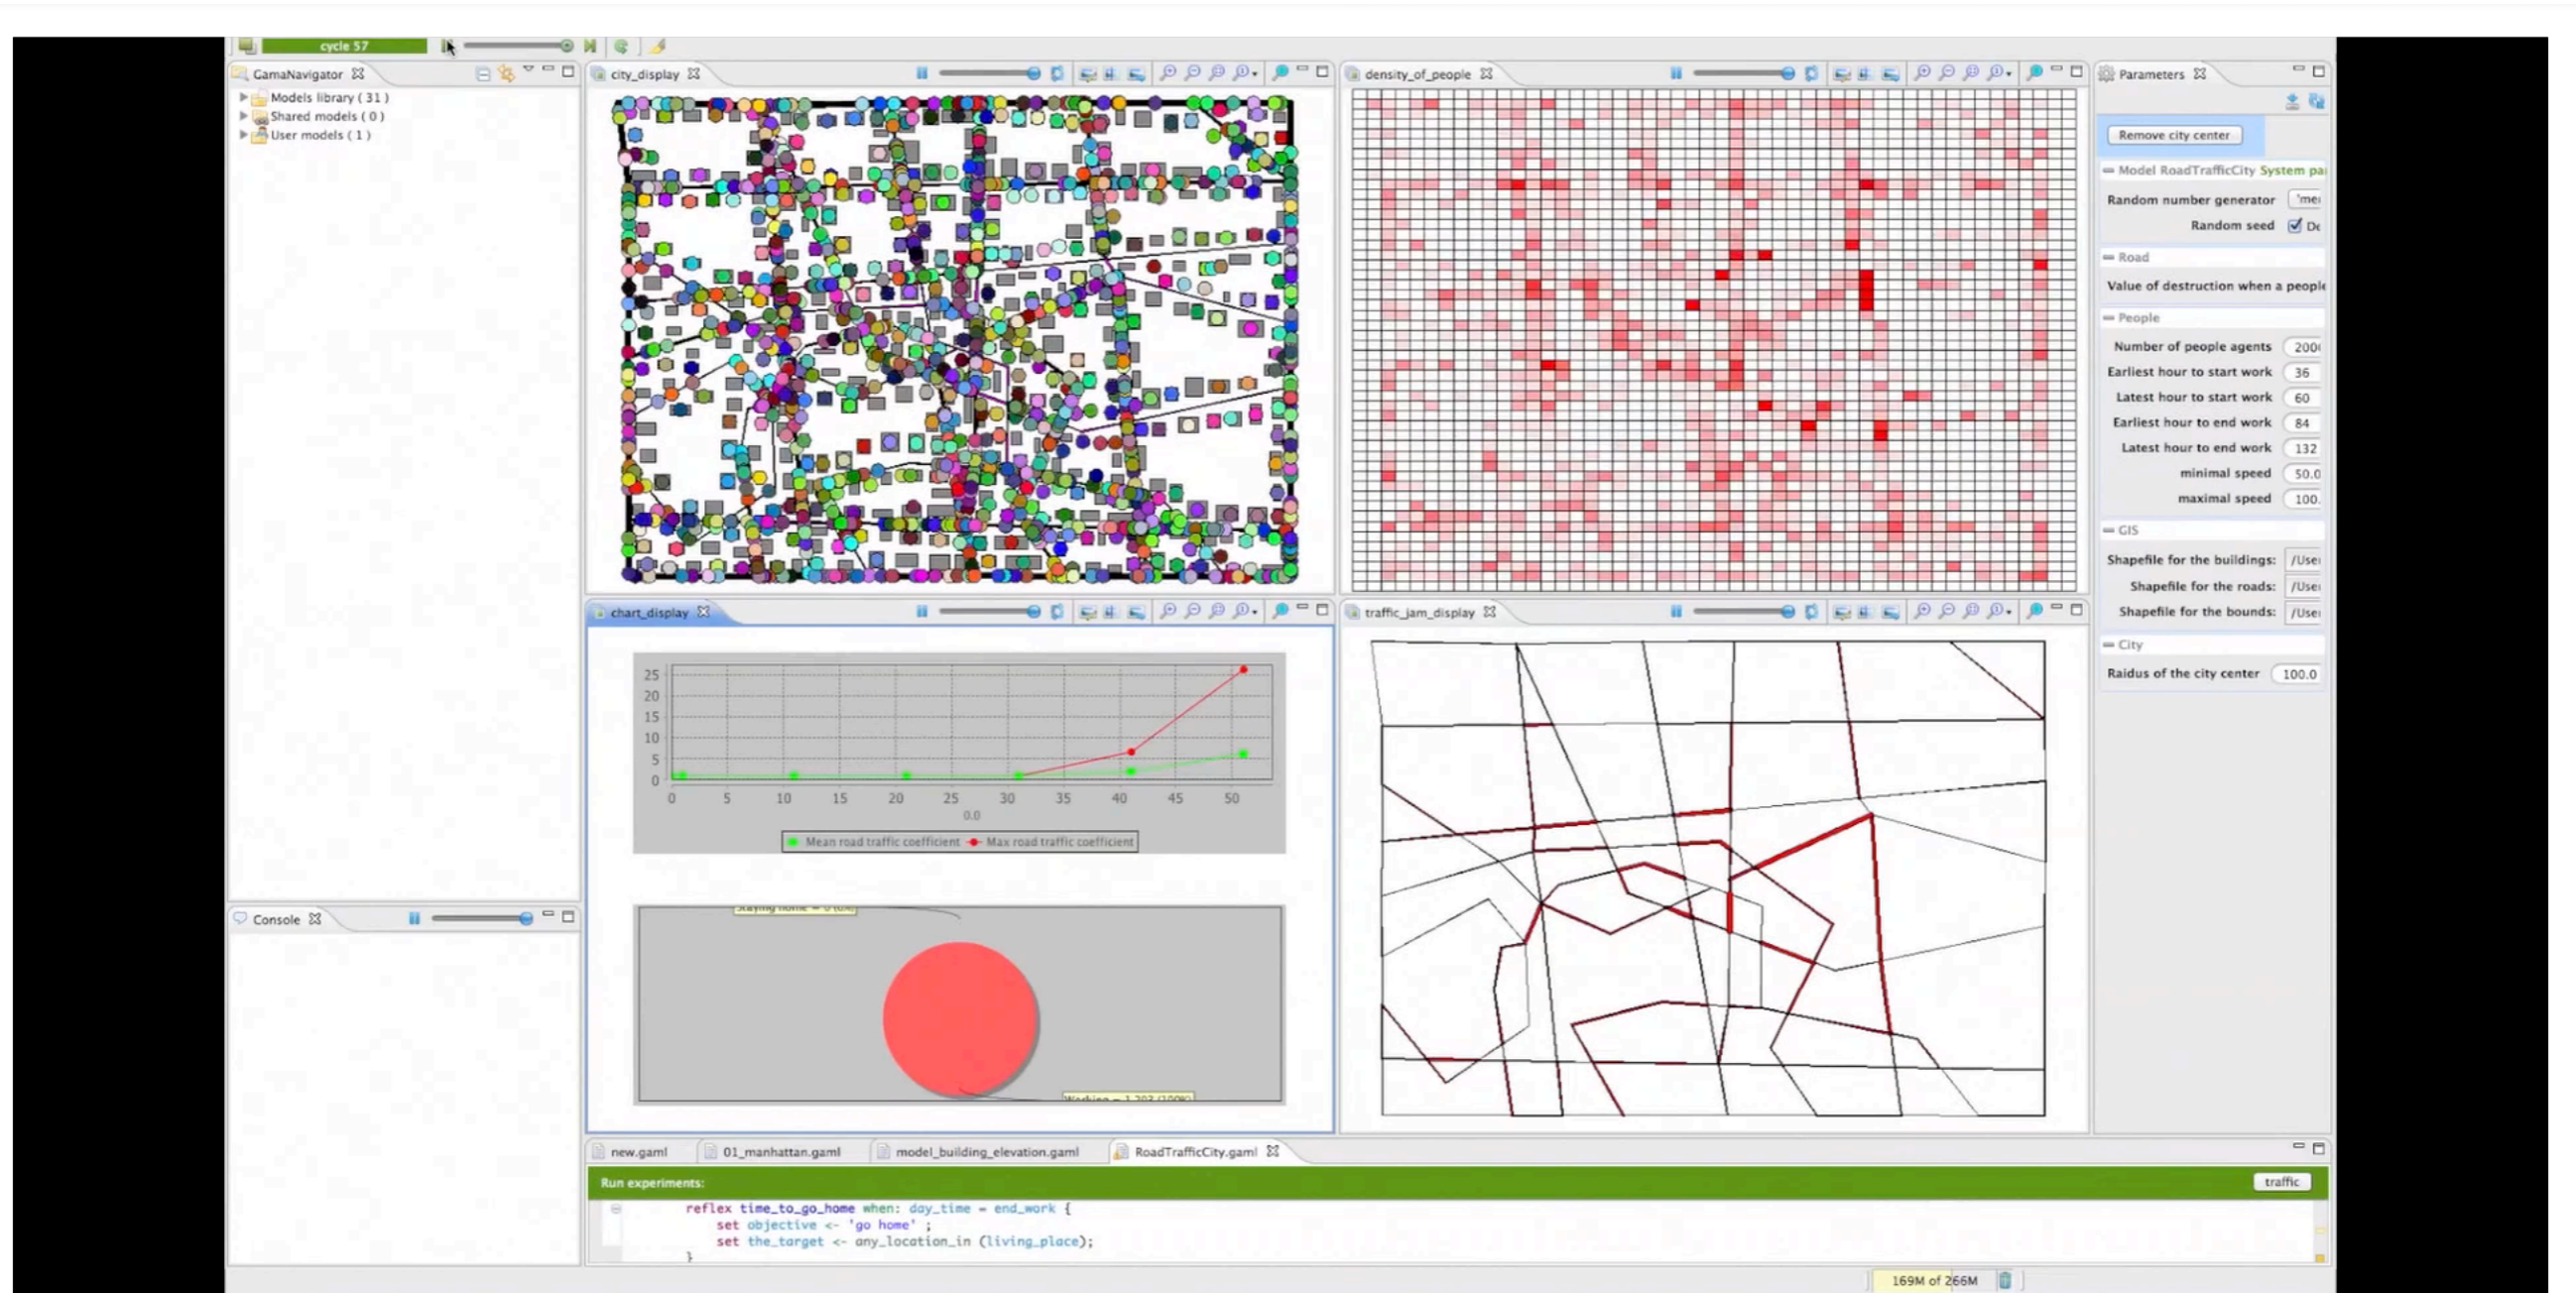

Main *features* of the Gama Platform

GAMA provides a complete Integrated Development environment (IDE) to build models

Dedicated modeling Language (GAML), easy to learn and to extend

Possibility to define as many environments as necessary (available: continuous, grid and graph)

2D Grid (rectangle, hexagon)

Continuous environment, torus environment, graphs

Native integration of spatial data

Many features to make agents move

Powerful tools of visualisation (2D-3D)

Allows to use different formalisms to define agent behaviours

The screenshot displays the GAMA simulation environment. On the left, a file browser shows a 'Models library' with various models. The main window is split into several panes:

- Agent-Based Model:** A central window titled 'sir_display' shows a 2D spatial simulation with numerous green dots (susceptible) and a few red dots (infected) on a black background.
- Equation-Based Model:** A window titled 'SI' shows a line graph with the y-axis ranging from 0 to 500 and the x-axis from 0 to 2. The graph shows a green line at 500, a red line at 0, and a yellow line at 0. A legend below the graph identifies the lines as S (susceptible), I (infected), and R (immune).
- Parameters:** A 'Parameters' window on the right lists system parameters for an experiment named 'simulation', including Mortality (0.0), Size of the neighbours (2), Number of Infected (5), Survival Probability (0.00003913), Number of Susceptible (495), Number of Removed (0), Beta (S->I) (0.05), Is the infection is computed locally? (checked), and Delta (I->R) (0.01).
- Code Editor:** A window at the bottom shows GAMA code for a reflex:

```
reflex become_immune when: (is_infected and flip(delta)) {  
  set is_susceptible value: false;  
  set is_infected value: false;  
  set is_immune value: true;  
  set color value: rgb('yellow');  
}  
  
reflex shallDie when: Flip(nu) {
```

Annotations on the image:

- A box labeled 'Agent-Based Model' points to the 'sir_display' window.
- A box labeled 'Equation-Based Model' points to the 'SI' window.
- A box containing the following differential equations is positioned between the 'SI' window and the 'Parameters' window:
$$\frac{dS}{dt} = -\beta SI$$
$$\frac{dI}{dt} = \beta SI - \delta I$$
$$\frac{dR}{dt} = \delta I$$

Differential equations, Finite state machine, Reflexes,

Advanced features: multi-simulation, multi-level, co-modeling

Simulation exploration: Batch mode, headless mode, OpenMole and R

The screenshot shows the 'Parameters' window in OpenMole. It is titled 'Model si_model Parameters for experiment 'Genetic''. The window is divided into three main sections:

- Random number generator:** Set to 'mersenne' (among cellular, xor, java, mersenne). The 'Random seed' is checked and defined as 0.0.
- Exploration method:** A table showing the following parameters:

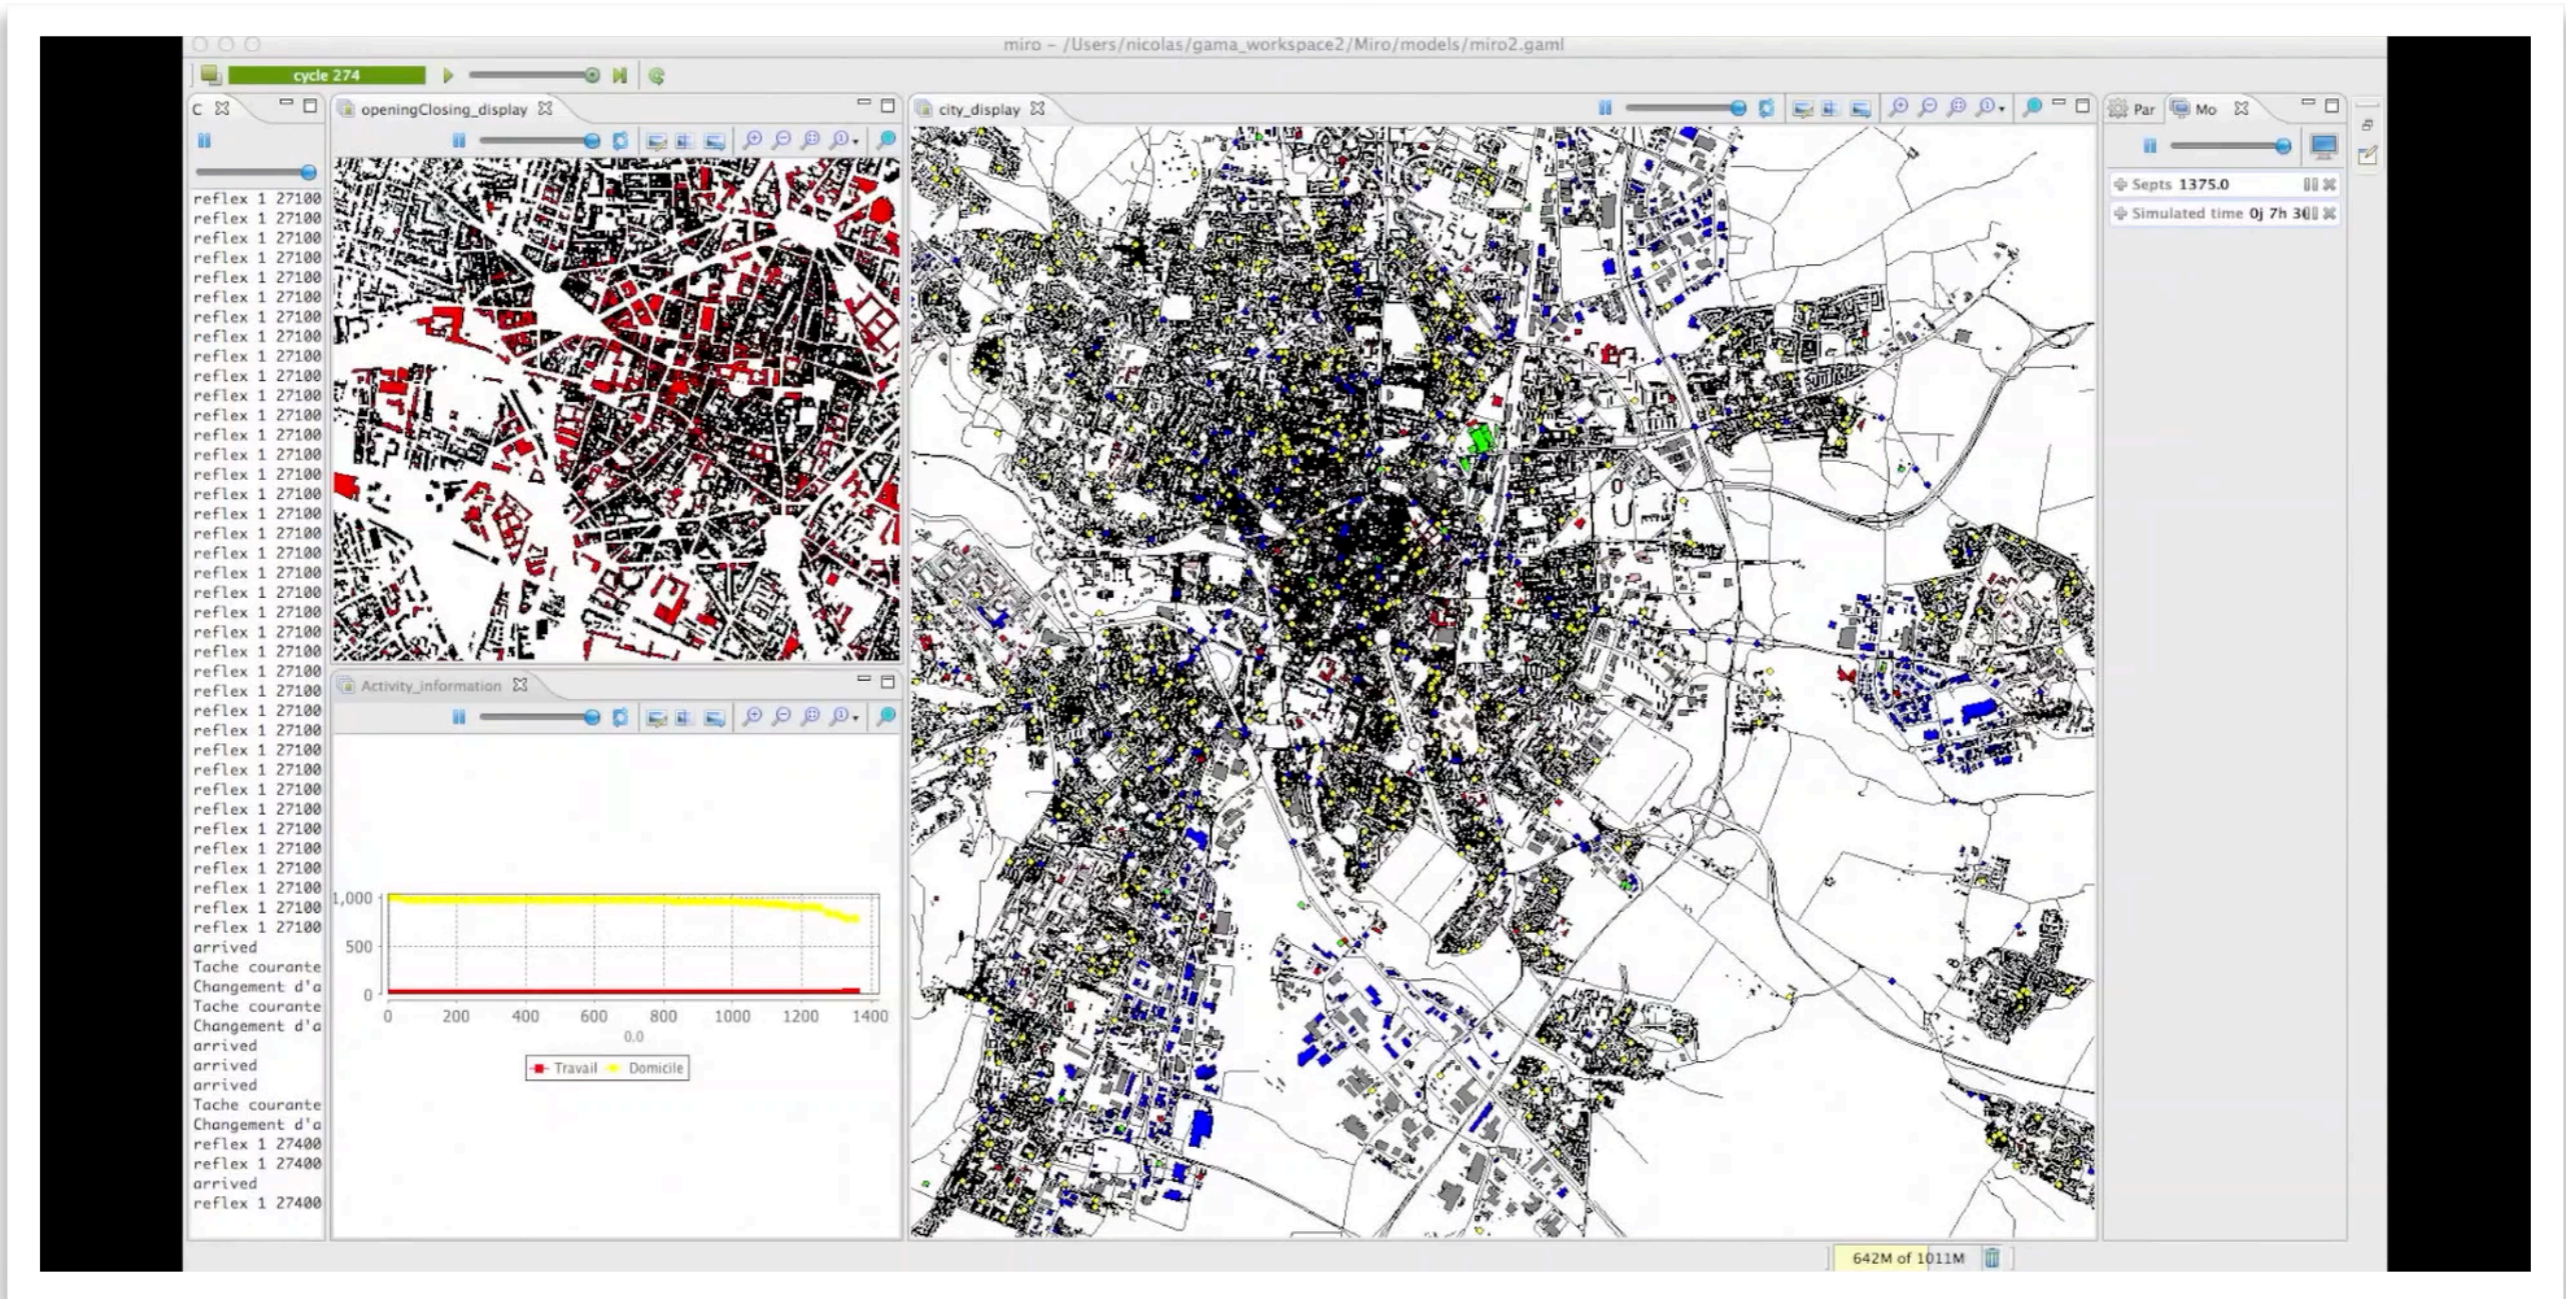

Stop condition	time > 1000
Best fitness	1.7976931348623157E308
Last fitness	299.0
Parameter space	infection_rate (6) * speed_people (10) = 60
Exploration method	Method genetic fitness = minimize nb_infected compute the min of 3 simulations for each solution
Mutation probability	0.1
Crossover probability	0.7
Population dimension	3
Preliminary number of generations	1.0
Max. number of generations	5.0
- Parameters to explore:** 'Infection rate' is set to 0.8 (among 0.1, 0.2, 0.5, 0.6, 0.8, 1.0). 'Speed of people' is set to 5.0 (between 1.0 and 10.0 every 1.0).

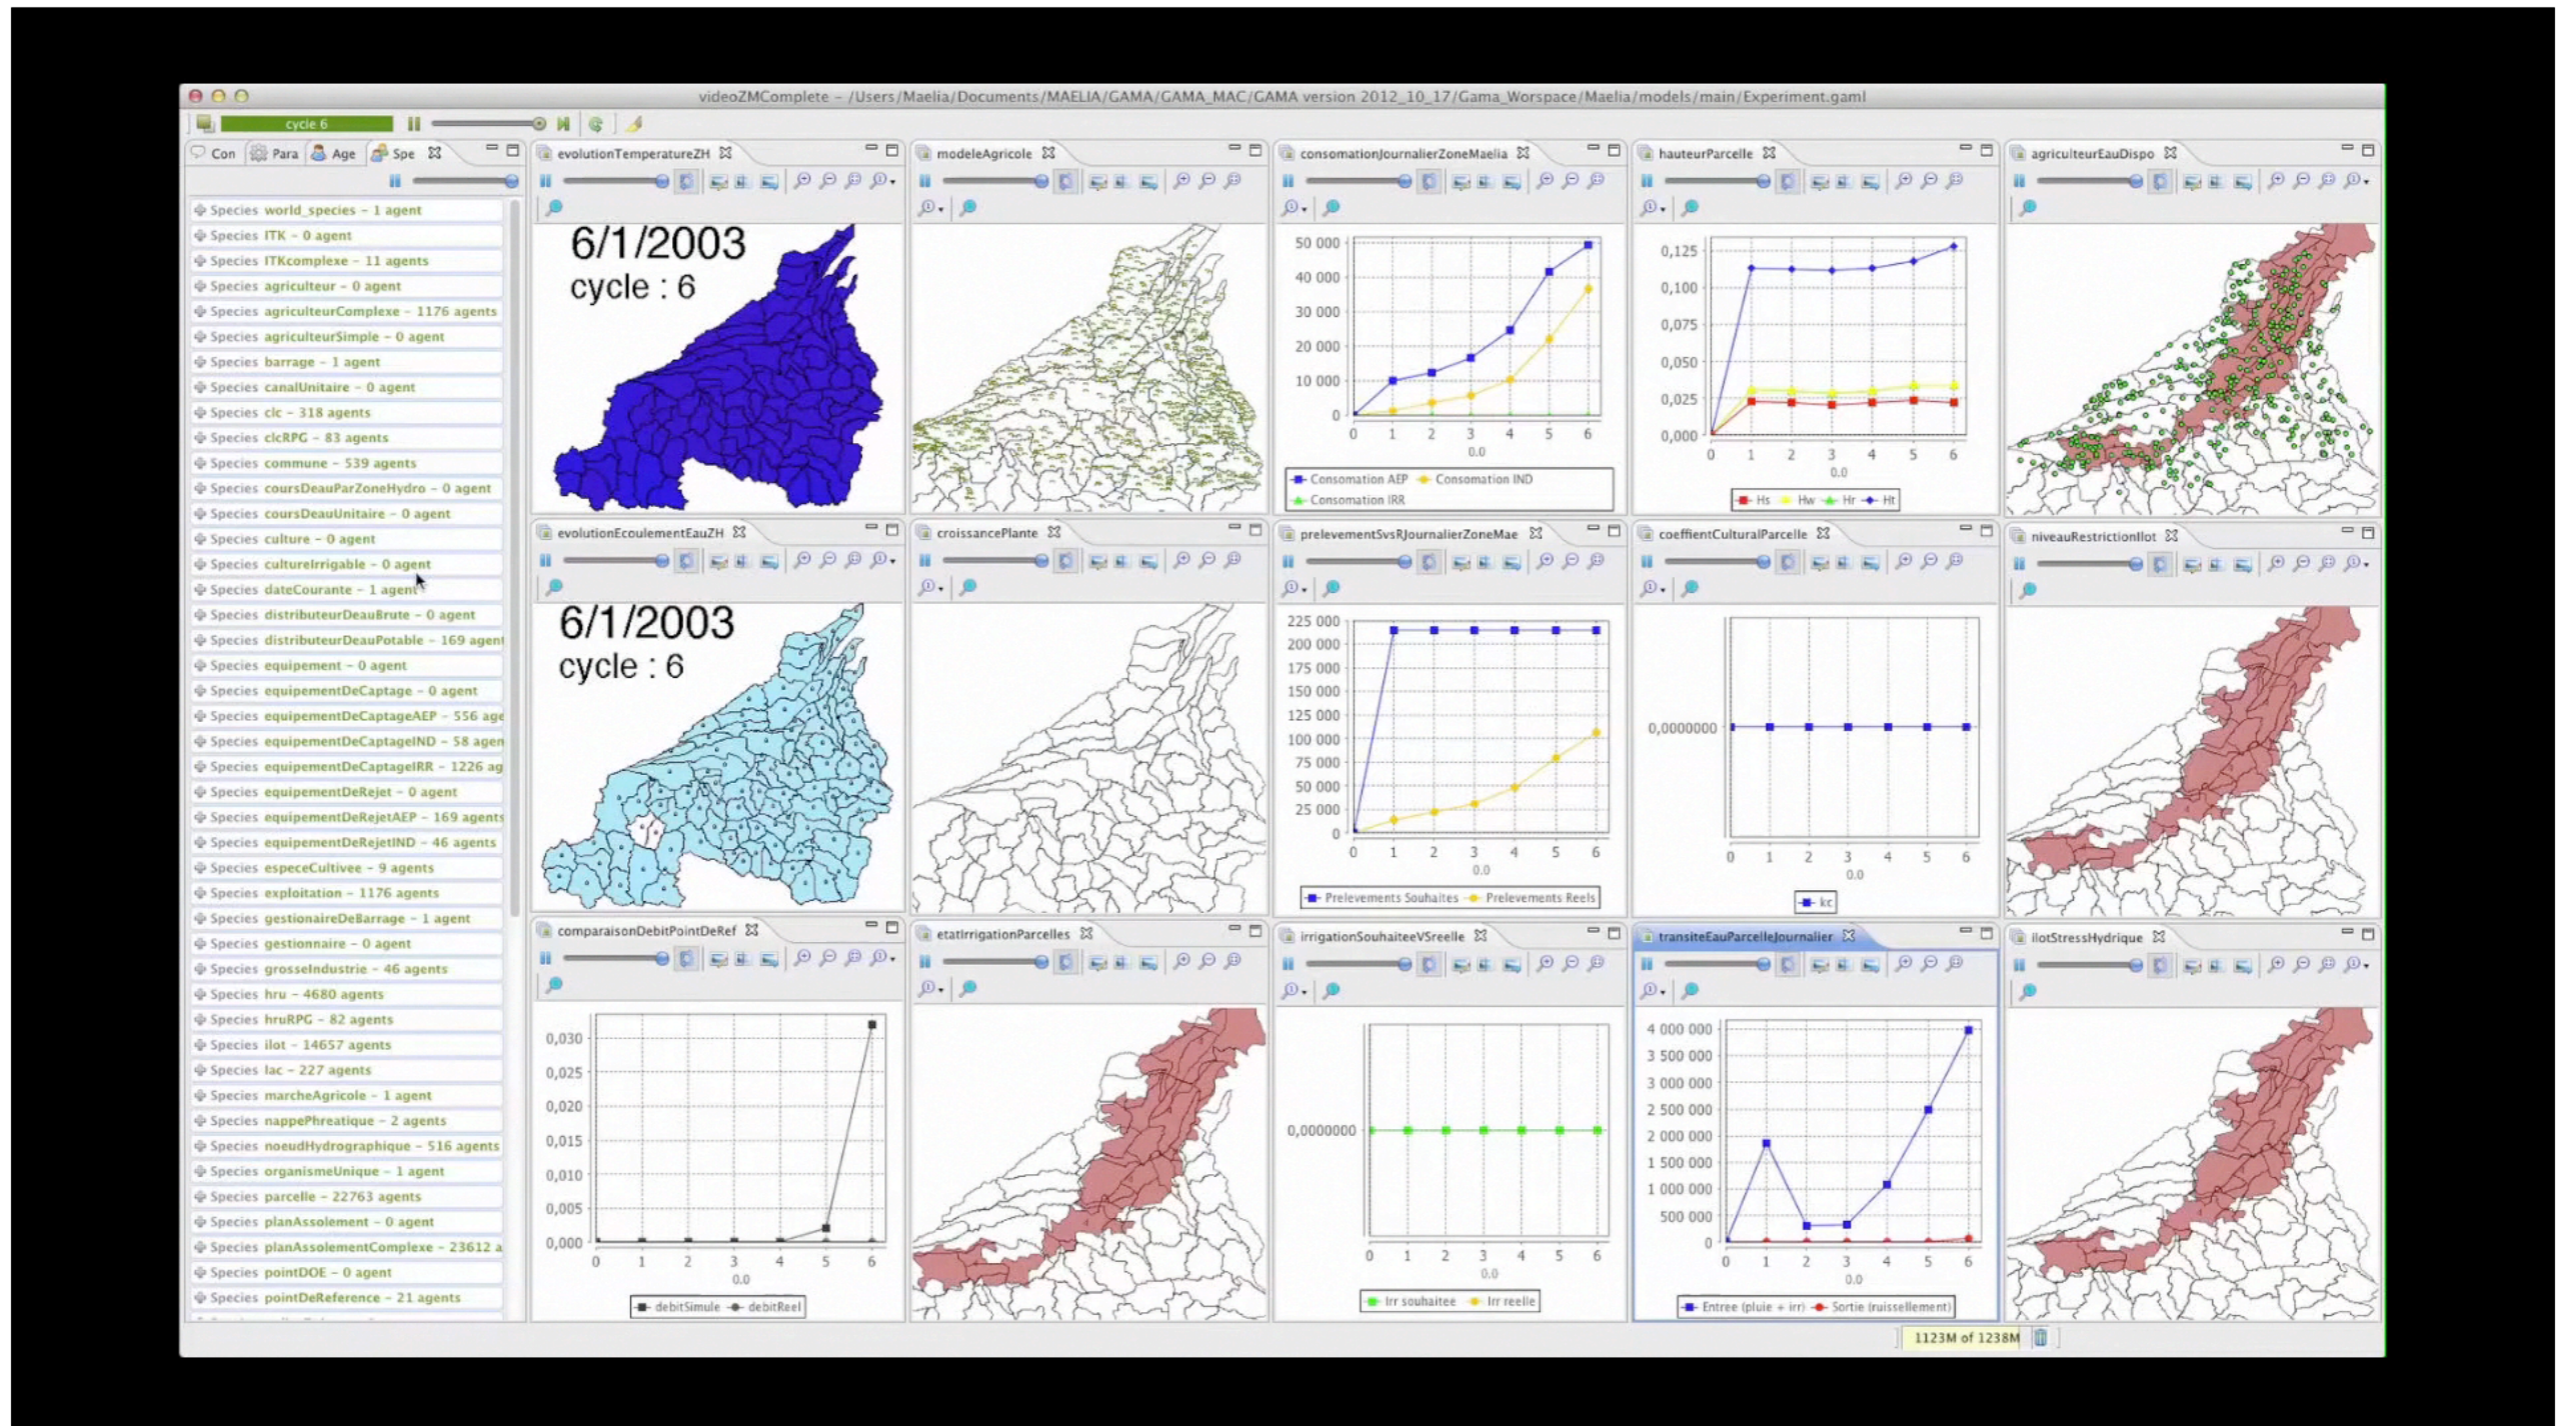

Parameter space exploration (exhaustive, tabu search, genetic algorithm,..), Compatible with OpenMole and R

Examples of *applications* of the GAMA Platform

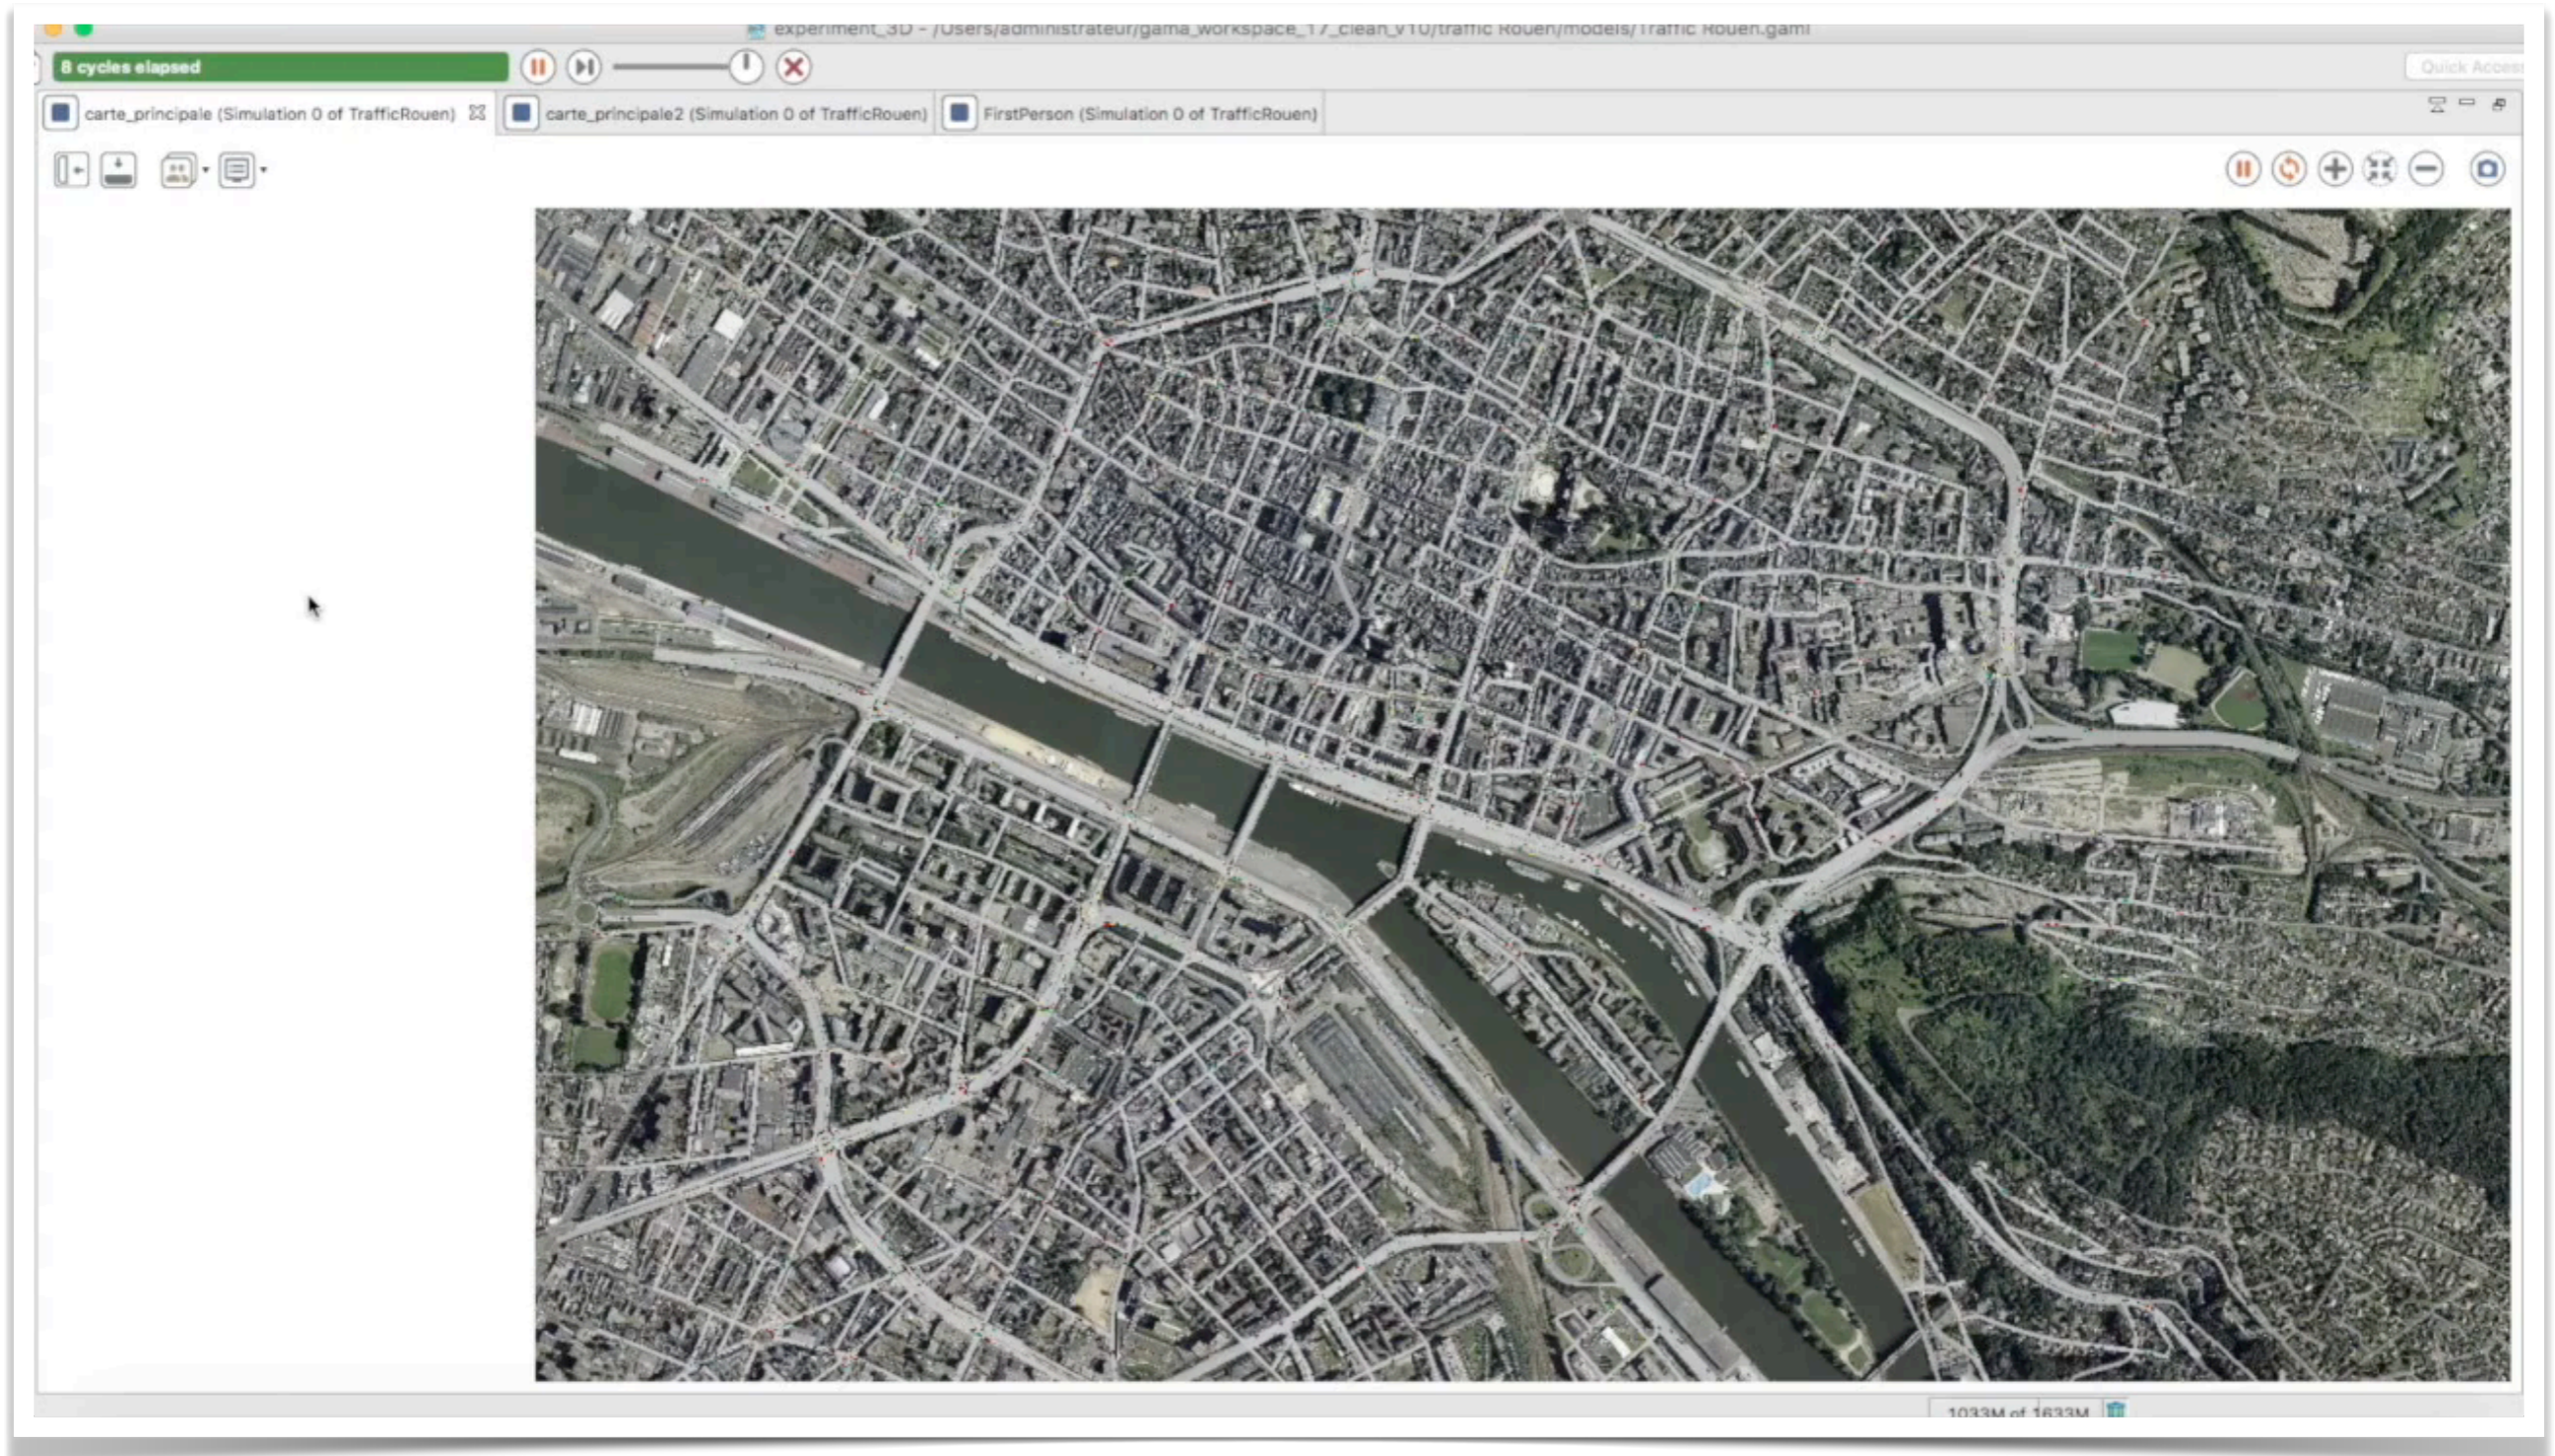

Dijon city, France: how to improve the individual accessibility to the city in order to better manage urban mobility ?

Adour-Garonne basin, France: what is the socio-environmental impact of water management norms on water resources?

MOSAIC (Rouen, France): Simulation of the traffic

Impact of the building design (BIM file) and inhabitant behaviors (cognitive agents) on energy and pollution

GAMA, modeling made easy

GAMA PLATFORM

Rhone river: sediment flow

Oléron Island: Participative simulations about floods

(a) Planning time: municipality players seat at separate desk

(c) Submersion time: players gather around the submersion display

(b) Planning time: players use a computer tablet

HoanKiemAir (Hanoi, Vietnam)

simulating impacts of urban management practices on traffic and air pollution using a tangible interface

ARCHIVES (Hanoi, Vietnam)

Reproduction of past crisis events: the flood of 1926 in Hanoi

N. Gasmi, A. Grignard, A. Drogoul, B. Gaudou, P. Taillandier, O. Tessier, and D. A. Vo. Reproducing and exploring past events using agent-based geo-historical models. In E. Norling and F. Grimaldo, editors, International Workshop on Multi- Agent-Based Simulation (MABS), Paris, France, Volume 9002 of the series LNCS, pp 151-163. Springer-Verlag, 2015.

ESCAPE project (Hanoi, Vietnam)

Massive and multi-modal evacuation in case of dam break

- ❖ **Dijon city, France:** how to improve the individual accessibility to the city in order to better manage urban mobility ?

Station Night club, Rhode Island (U.S.A)

Night club evacuation with cognitive and social agents

Valette, M., Gaudou, B., Longin, D., & Taillandier, P. (2018). Modeling a Real-Case Situation of Egress Using BDI Agents with Emotions and Social Skills. In International Conference on Principles and Practice of Multi-Agent Systems (pp. 3-18). Springer, Cham.

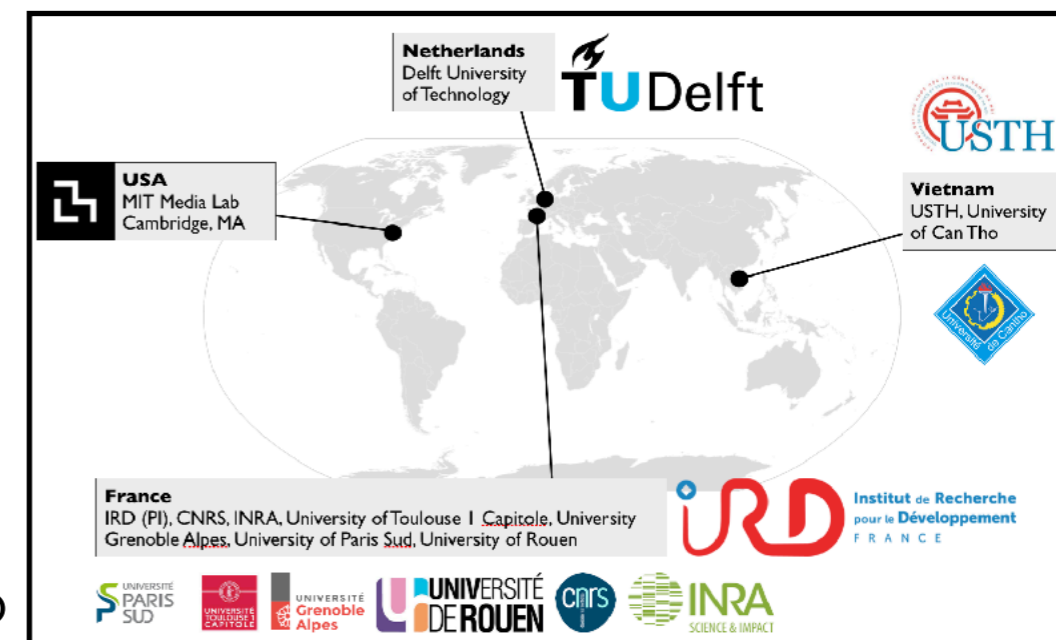

Conclusion

To conclude:

- ▶ Developed under GPL license : **open-source**
- ▶ 6 French people with **permanent positions** (in 4 institutions) are (actively) involved in implementing GAMA + several former Vietnamese PhD students with a lecturer position in their institutions + non-permanent
- ▶ It is used in **several lectures and training sessions** (mainly in France, South East Asia, Africa, Brazil ...).
- ▶ It is the support of several French and international projects.
- ▶ Valorisation process in progress to build a consortium around GAMA.
- ▶ **Very active mailing lists!!**
 - answer questions, help, model corrections
 - easy to request enhancements for the platform to fit with user needs

Last version: 1.8
